

Listing Products

How to add a product to the catalog after your seller application is approved. Products are moderated before publication.

Version: June 2026

1. Prerequisites

- Seller account created and email confirmed;
- Onboarding completed, application status is **Approved**;
- You can log in to the dashboard: <https://reli.one/seller/login>.

Before application approval, product management sections are unavailable or redirect to onboarding.

2. "Goods" section

After logging in, open the **Goods** section. The start page offers two actions:

- **List of goods** — view products you have already created;
- **Adding goods** — create a new product.

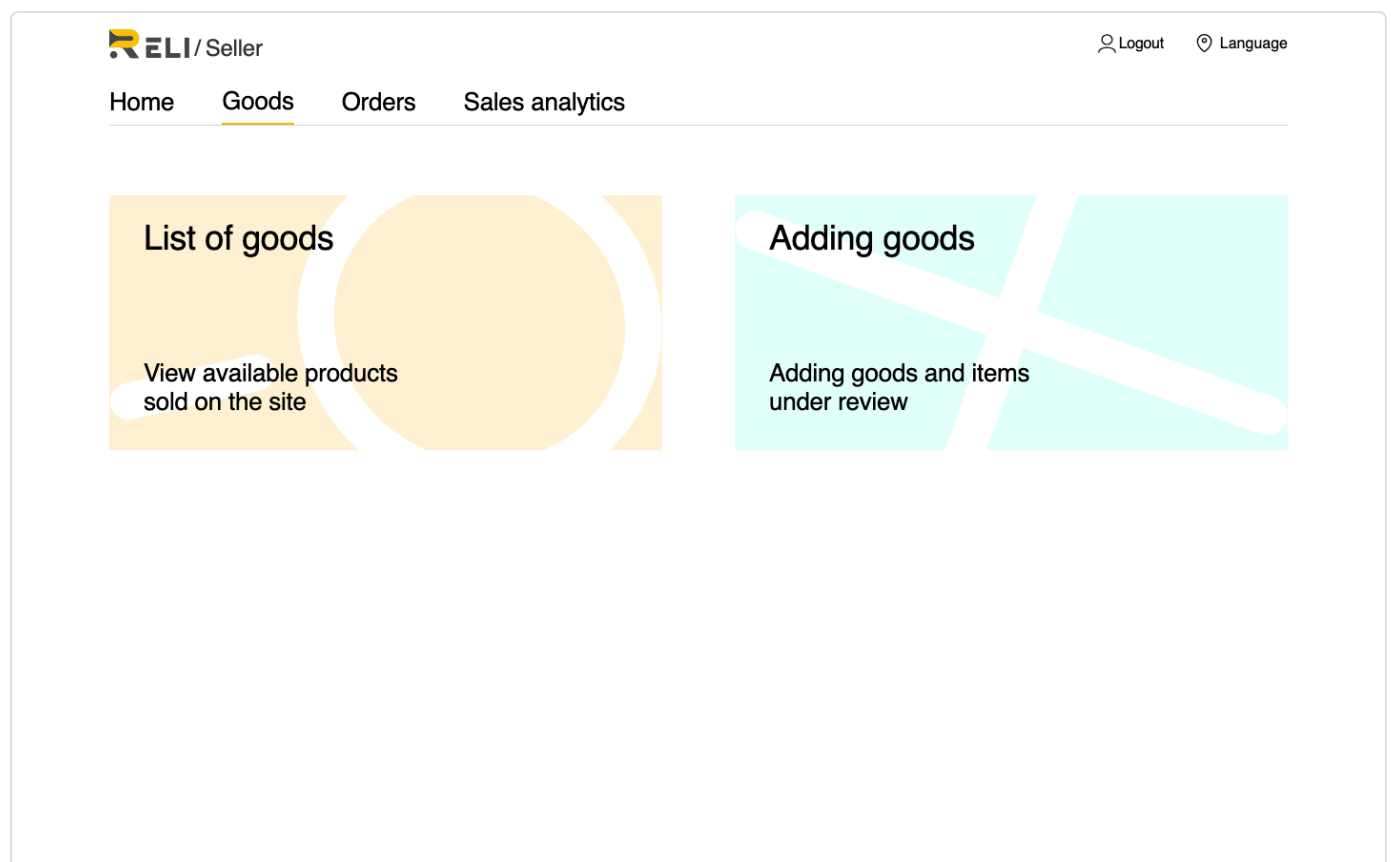

Fig. 1 — Page <https://reli.one/seller/goods-choice>

3. Creating a product

Click **Adding goods** or go to <https://reli.one/seller/seller-create>.

3.1. Required fields

Some fields are the same for all products. Others — **category attributes** — are loaded automatically after you select a category and may differ for different categories and subcategories.

Always required

Field	Description
Category	Catalog category. Usually select a leaf (final) category; in some branches, products are also allowed in a parent category.
Goods name	Product name
Description	Product description
Photo	At least one image (JPG, PNG, WebP)
VAT rate, %	VAT rate. If left empty, the system saves 0%.
Variant type name	Variant type name (e.g., "Size", "Color")
Variants	At least one variant. For each variant, required: value, price, stock quantity, package weight, and dimensions (length, width, height) — for shipping calculation.

Category and subcategory attributes

After you select a category, the form loads an attribute schema. It includes:

- attributes defined for the selected category;
- attributes from parent categories (inherited in subcategories);
- when an attribute code matches in a child category, the subcategory definition is used.

Only fields marked as required in the schema must be filled in (types: text, number, yes/no, select from list). If a category has no required attributes, you can skip this block. When you change the category, the schema reloads — review the fields again.

The **Characteristics** block (custom "name — value" pairs) is optional. However, if you start filling in a characteristic row, you must provide both name and value.

3.2. Optional fields

- Brand — brand name (text, at least 2 characters);
- Seller article — seller SKU (digits only, at least 10). If omitted, the system generates an article automatically;
- EAN/UPC barcode — barcode;
- Additional details — additional information;
- Country of origin — country of origin;
- Warranty, months — warranty in months (integer > 0);
- 18+ / age restricted — age restriction flag;
- License / Certificate — certificate or license (PDF, JPG, PNG, WebP, up to 13 MB).

4. Preview and submit for moderation

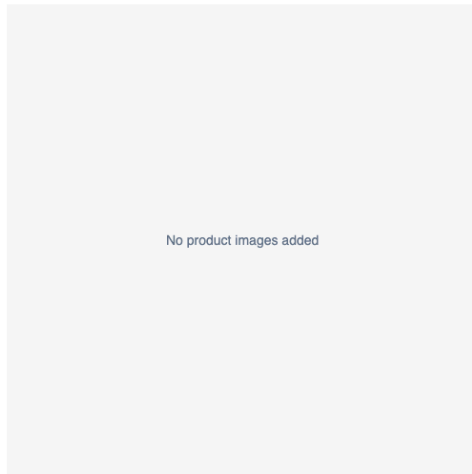

After completing the form, click **Preview** at the bottom of the product creation page — the preview screen opens. Review the description, characteristics, variants, and images, then click **Sending for moderation**.

The product status becomes *On moderation*. Typical moderation time is about 24 hours. After approval, the product appears in the public catalog with status *Active*.

Creation of goods

● **Preview mode.** This is how your product will appear to buyers after approval. Review all fields carefully before submitting for moderation.

5. Pre-submission checklist

1. Category is correct; all required category and subcategory attributes are filled in.
2. Description is clear, typo-free, and includes key characteristics.
3. Photos are sharp, 1:1 aspect ratio, product is clearly visible.
4. Each variant has value, price, stock, and package dimensions.
5. VAT rate is correct; seller article is verified (or left for auto-generation).
6. Certificate / license attached if required.

6. Common issues

Problem	Solution
Category attribute schema does not load	Reselect the category or refresh the page. Make sure you selected a category where product creation is allowed
Expected attributes are missing	Attributes depend on category: some are defined in the parent category, others in the subcategory. Select the exact product category
Submit button inactive on preview	Check required attributes and variants
Product stuck "On moderation"	Wait for moderator decision; if delayed > 48 h — contact support
Product rejected	Fix the feedback and resubmit via Edit

7. Managing the product list

All your products are available at <https://reli.one/seller/goods-list>. Use tabs to filter:

- **Active** — approved and published;
- **On moderation** — awaiting review;
- **Not moderated** — drafts and rejected items.

For each product, **Edit** (edit) and **Del** (delete) are available. When you edit an approved product, its status changes to *Pending* again — the product is temporarily removed from the catalog until re-moderation.
